

# Modified regional DNDC and its application in Athabasca River basin

Baoqing Deng  
Athabasca river basin institute  
Athabasca University

# DNDC

- **DNDC: DeNitrification-DeComposition Model**
  - Denitrification: dominating N simulation
  - Decomposition: dominating C simulation
- DNDC can simulate soil C and N dynamics.
- DNDC can simulate crop growth.
- DNDC can simulate the emission of trace gas such as NO, N<sub>2</sub>O, CH<sub>4</sub>, and NH<sub>4</sub> from agricultural ecosystem and wetlands.

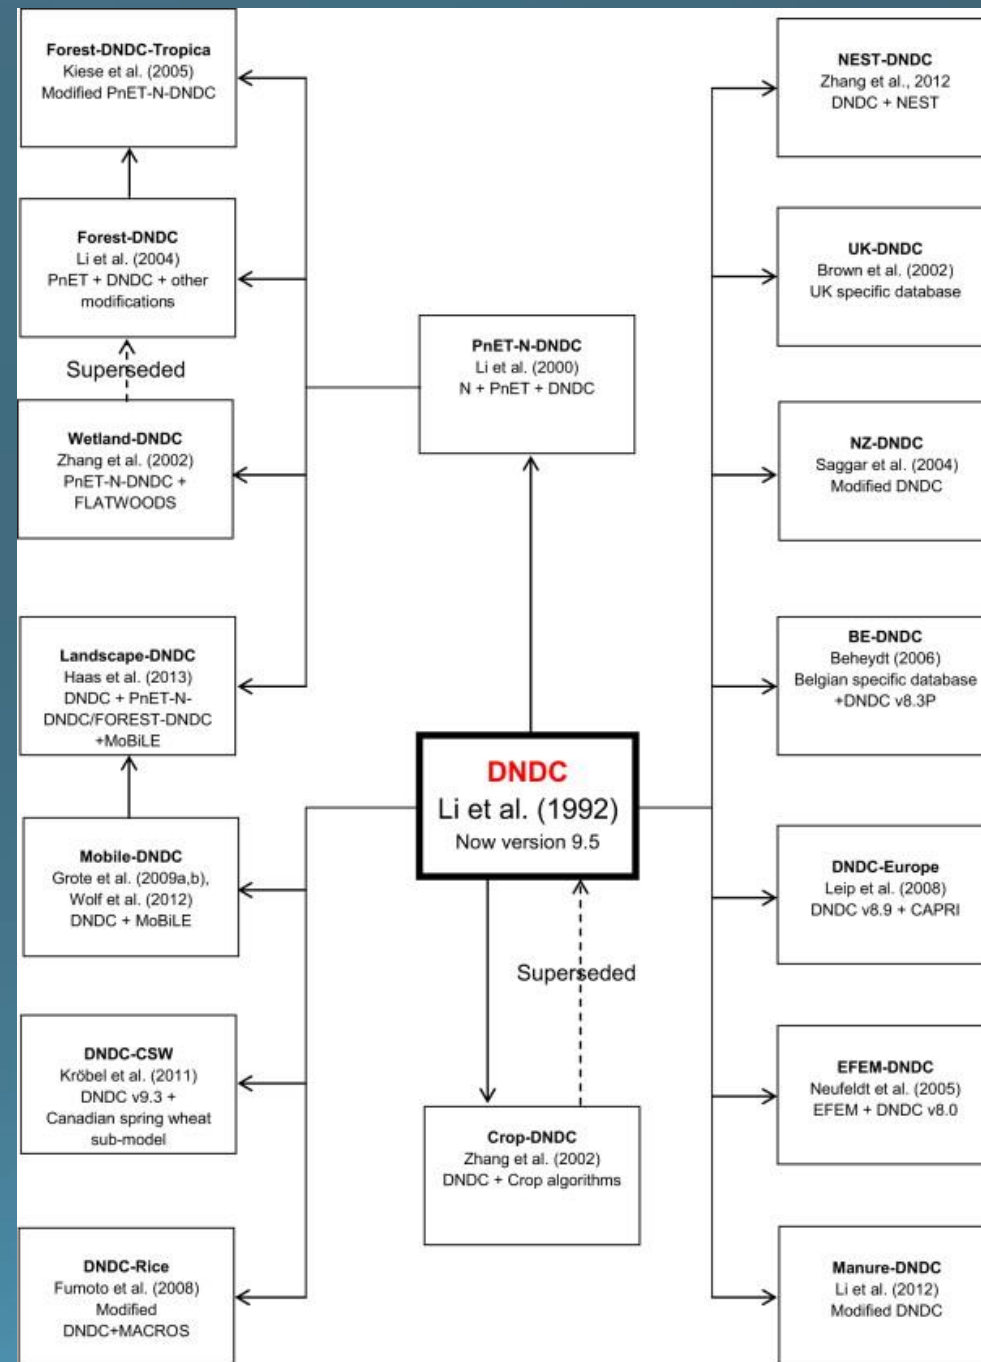

# DNDC: a process based model

- **Biogeochemical processes**
  - decomposition
  - Hydrolysis
  - nitrification
  - Denitrification
- **Management**
  - Irrigation, Weeding, Flooding, Manuring, Cropping, etc.

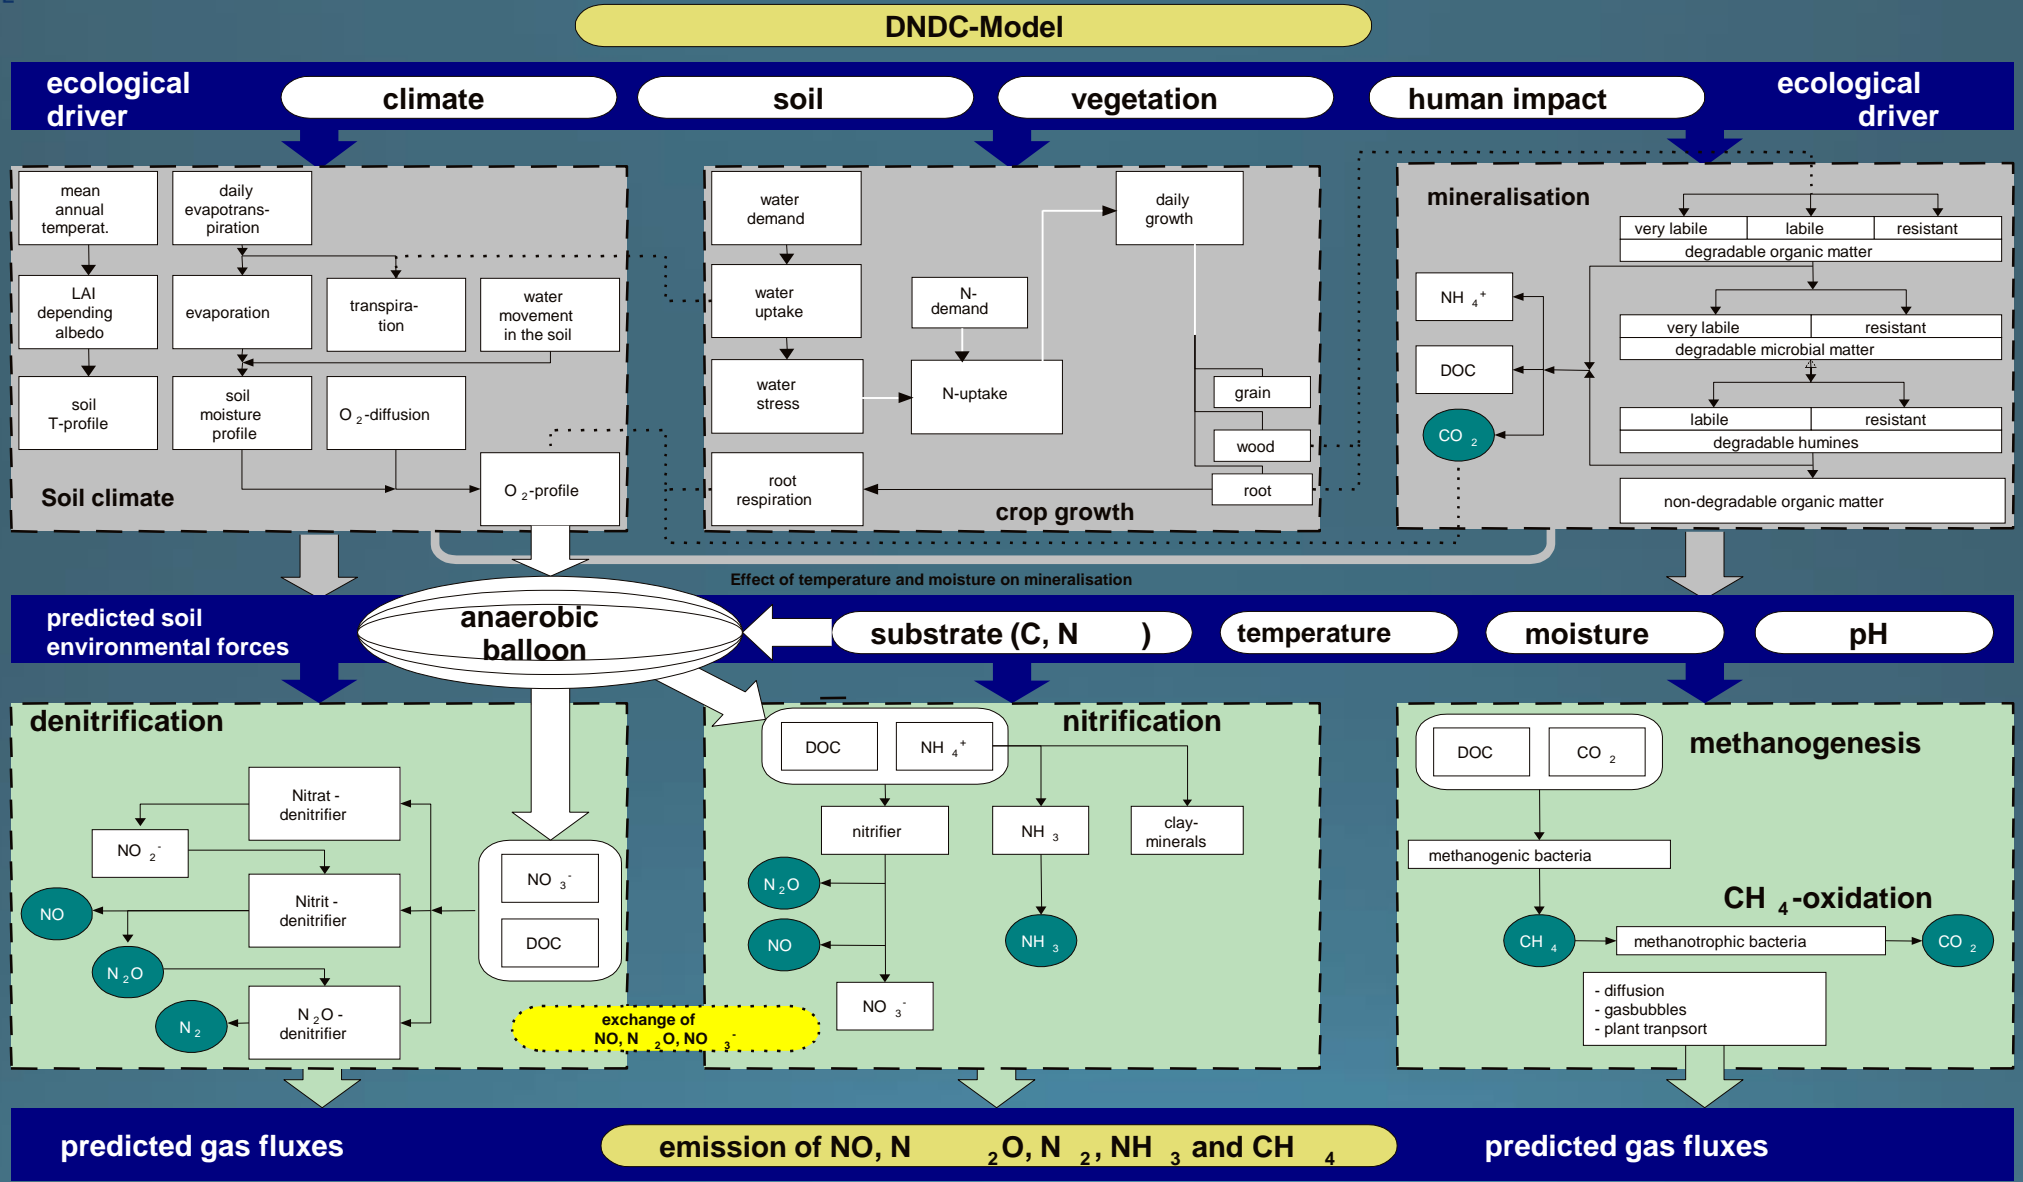

# DNDC model family

- A great success in modeling agricultural ecosystem
- Many variants have been developed.

taken from Gilhespy et al. (2014), Ecological Modelling

DNDC structure

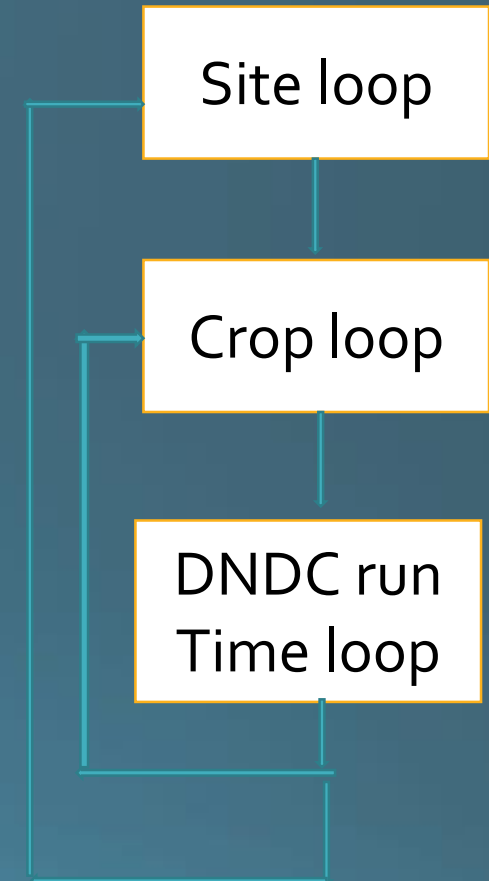

Changsheng Li, 1992, 2000, ...

# DNDC mode

- Site mode
- Regional mode
  - ✓ It is virtually a batch run of site mode.
  - ✓ Site leading
- Drawback
  - It is incompatible with Hydrological model which is time leading .
  - Different results may be produced for site mode and regional mode (Perlman et al., 2013, Environmental Modelling & Software)

## Regional mode

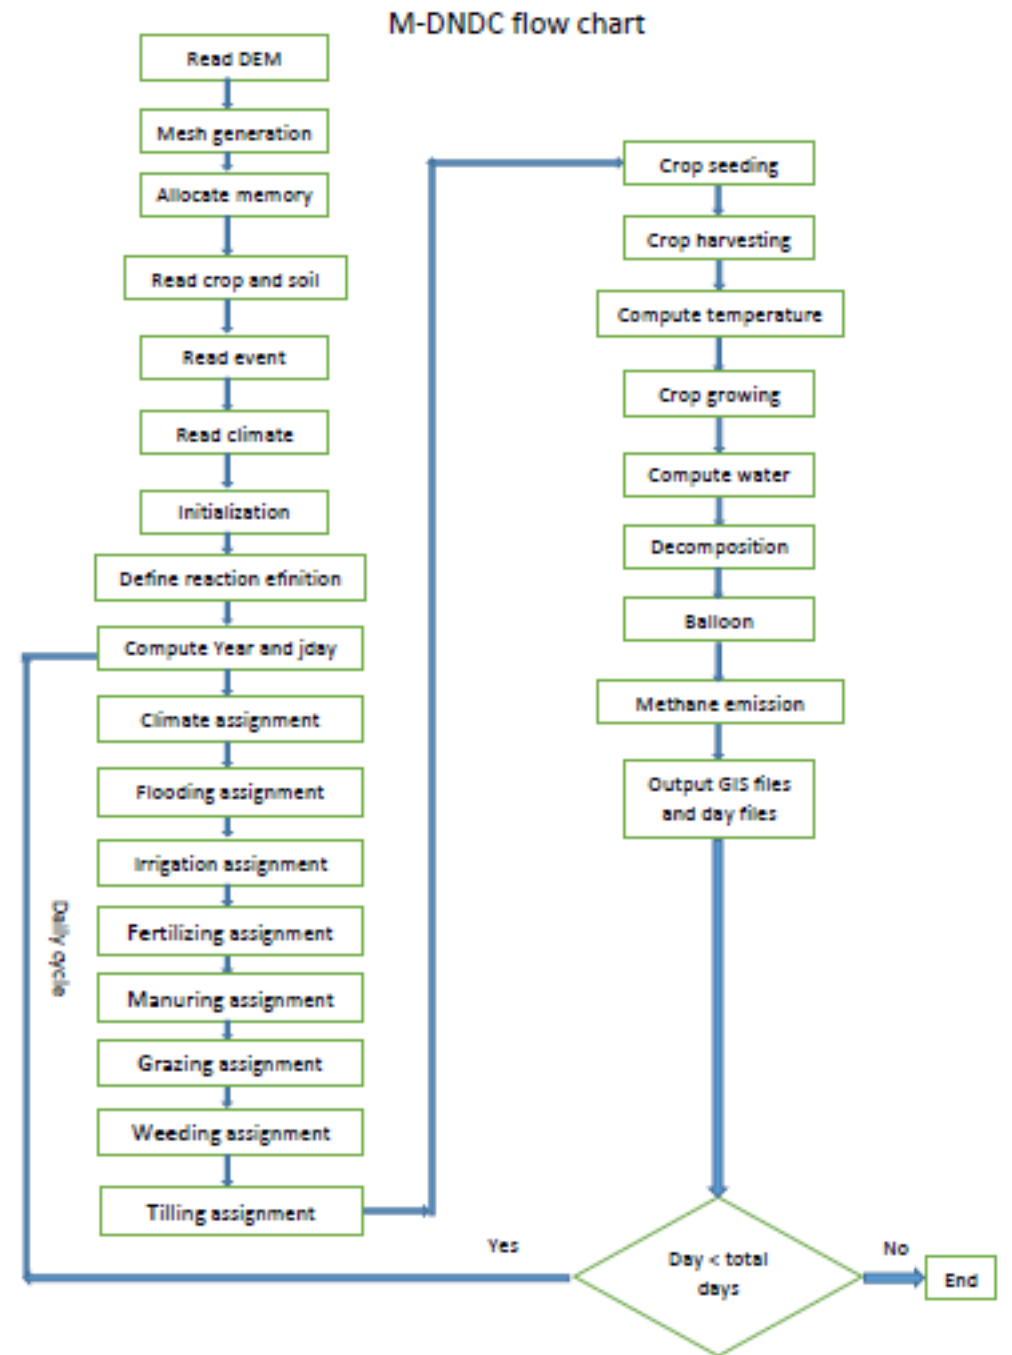

# Modified DNDC

- Time leading loop
- Structured module
- Derived data type
- Written in Fortran 2003
- Three dimensional Richards equation

# Flow chart

- Time leading loop
- Fully regional mode

# Structured module

- **Water-temperature module**
  - Exchange limited data with DNDC decomposition module and DNDC Denitrification module
  - Three dimensional Richards equation in sigma coordinate system
  - Infiltration boundary condition
- **Event module**
- **DNDC decomposition module**
  - Standardized reaction sub-module
- **DNDC Denitrification module**

# Crop data type

- **Linked list is created to simulate the seeding and harvesting of crops.**
- **It is related to the dynamic growth of crop.**
  
- **Merit**
  - **Arbitrary number of crops in the single site can be simulated.**
  - **It totally mimics the actual crop seeding and harvesting.**
  - **Memory can be saved.**

**type crop1\_type**

Crop area

Variables for common characteristics of crop, such as period of growth, etc.

Variables related to time, such as crop seed, etc.

Pointer for RICE

Pointer NEXT

**end type**

**type rice1\_type**

Variables related to methane

Variables related to growth stage of rice

**end type**

# DNDC main entrance and event data type

- patch data type
  - The main entrance
  - It contains a linked list for crop.
  - It contains climate information.
- Event data type
  - It describes the management event.
  - Totally eight data types

# Material parameter data type

- Reference soil data type
  - All variables related to soil are categorized together, such as water content at field capacity, water content at wilting point, density, specific heat, pH, porosity and hydrologic conductivity, etc.
- Reference crop data type
  - All variables related to crop are categorized together, such as the period of growth, etc.

# Input files

- Control file => running parameters
- Crop information files => Reference crop data type
- Soil information files => Reference soil data type
- Climate files name => file names
- Climate files => rainfall, temperature everyday
- Event information file => events in each year
- DEM files
  - Longitude, latitude, base concentrations
  - Management events
  - Soil parameters if obtained

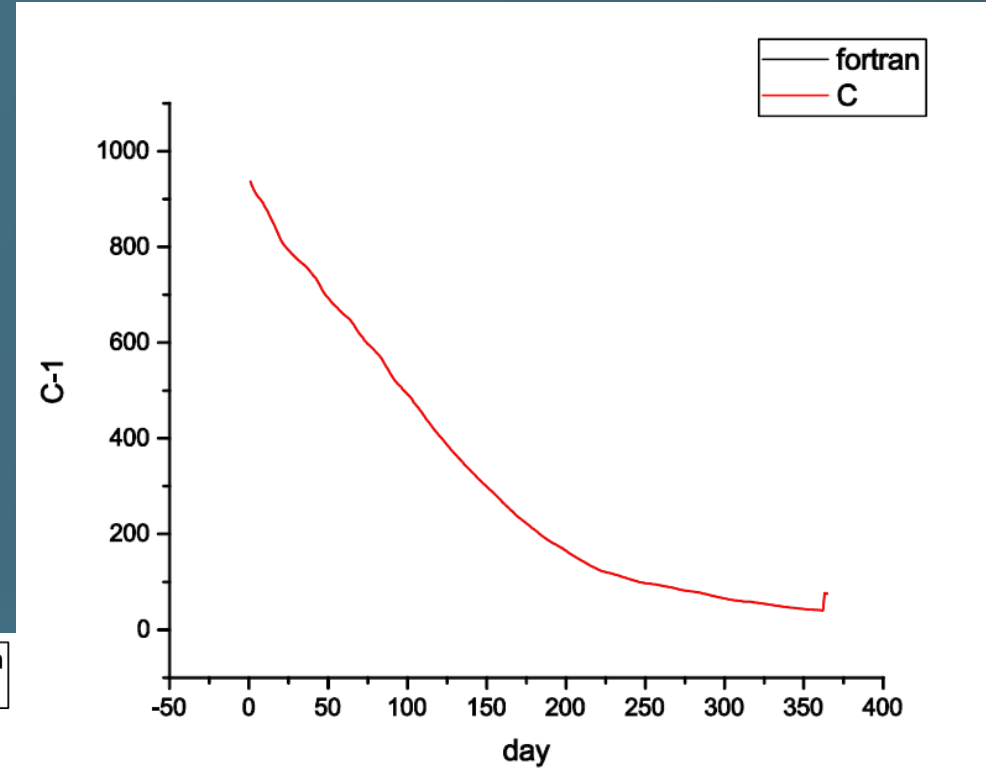

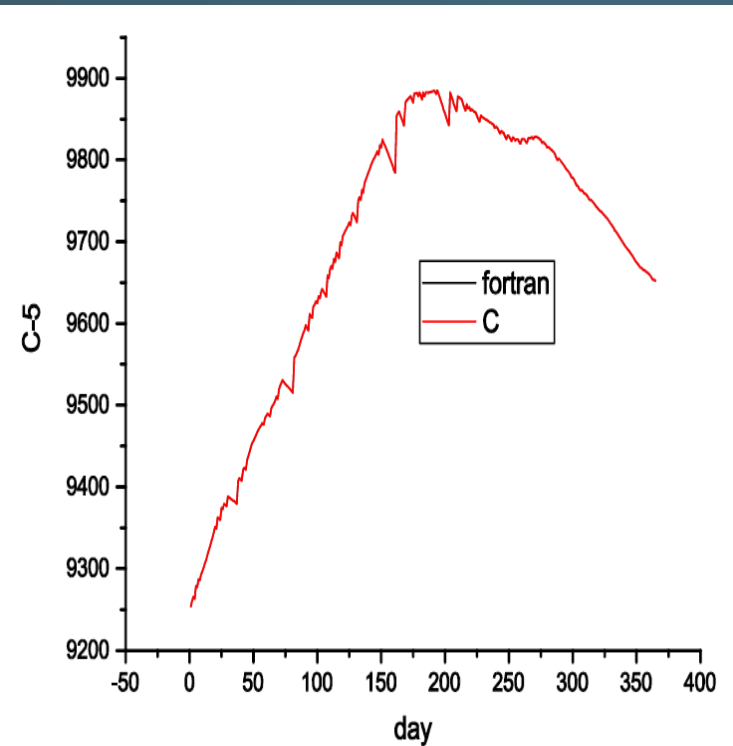

# Output files

- Tecplot format
- DEM format, same as the input files.
  - Any variable can be output, such as CO<sub>2</sub>, N<sub>2</sub>O, etc.

# Comparison with DNDC

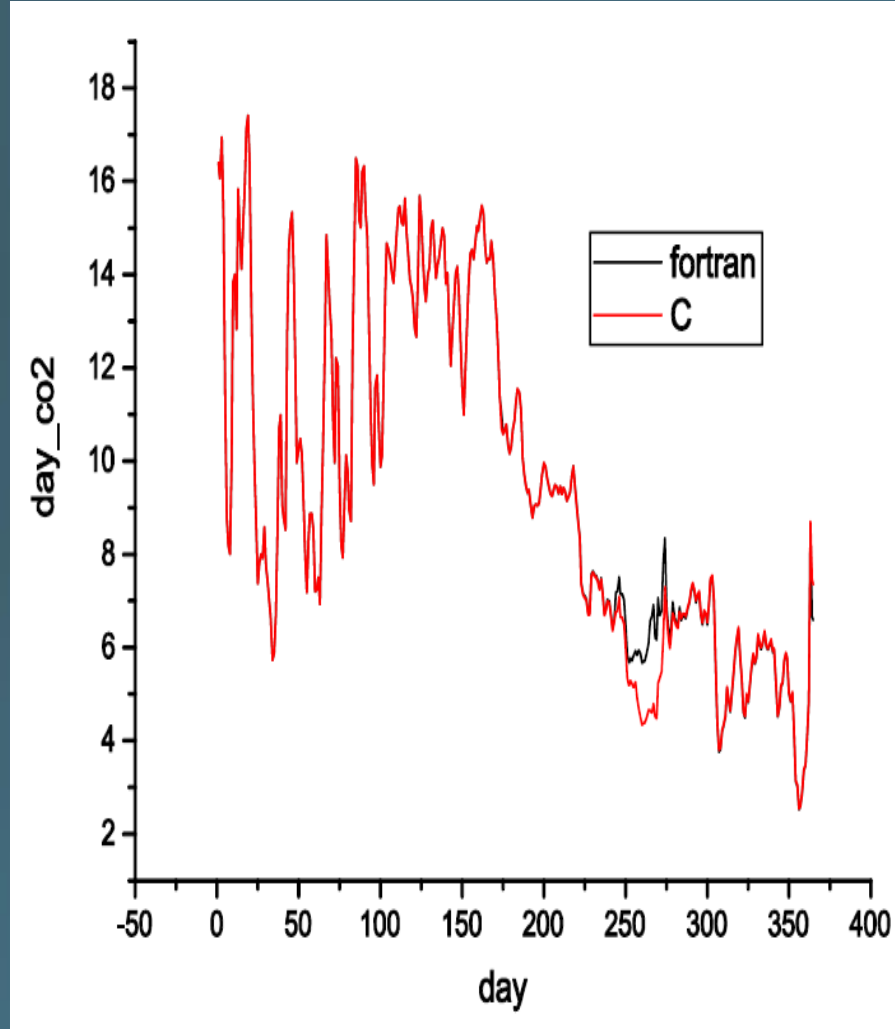

- The same water and temperature
- The same events

Subtlet difference

# Comparison with DNDC

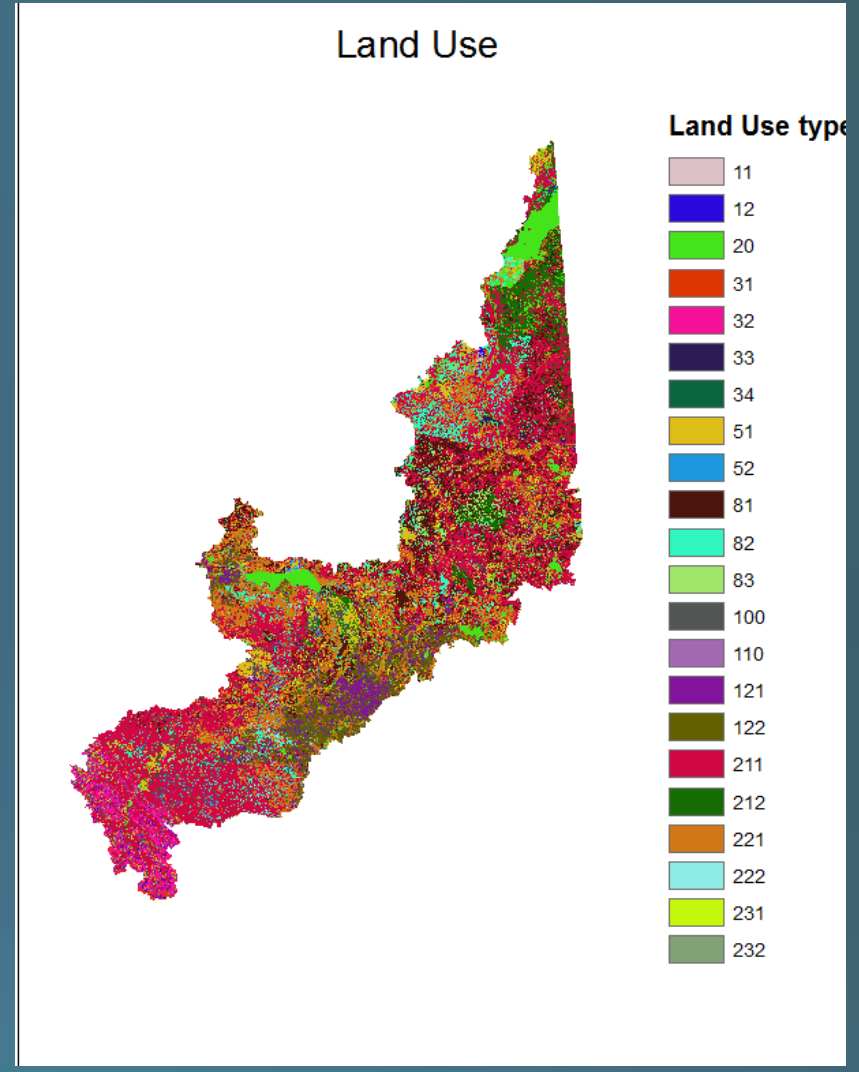

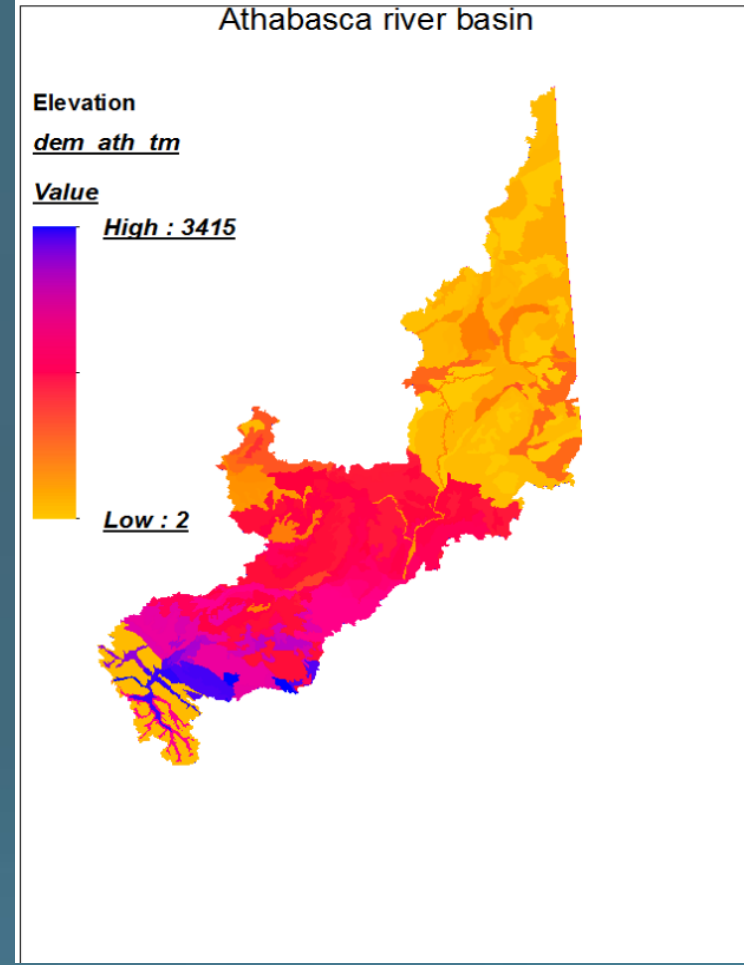

# Comparison with DNDC

# Regional Case:

## Athabasca River basin

# Simulation parameters

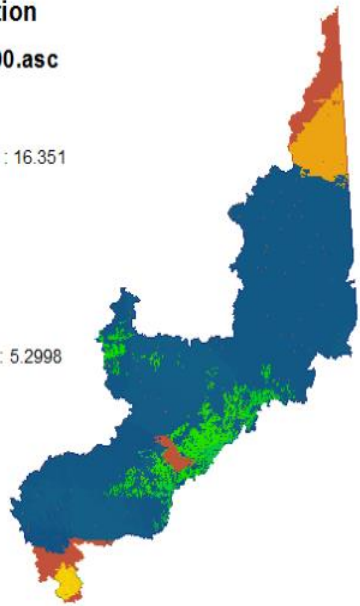

- **1 year simulation**
- **climate files from 33 stations**
- **Plants distribution**
  - **Wheat in agricultural area**
  - **Grass in other area**
- **Events**
  - **Irrigation, tillage, fertilization, crop seeding for agricultural area**

# CO<sub>2</sub> distribution

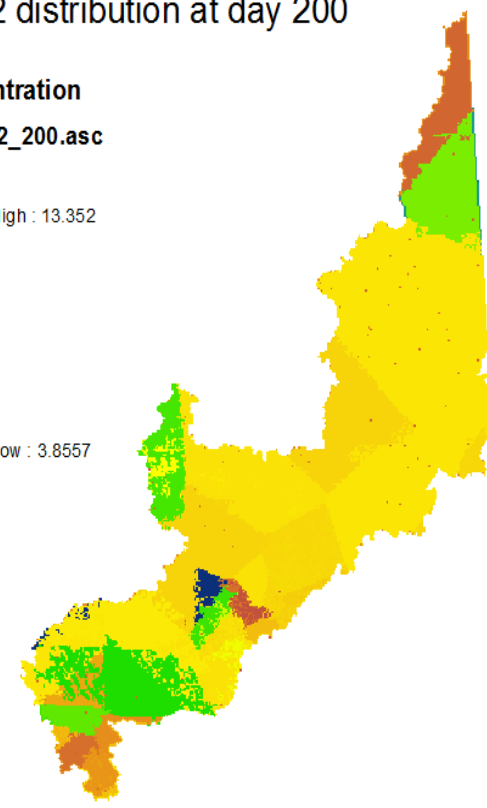

CO2 distribution at day 100

Concentration  
gis\_CO2\_100.asc  
Value

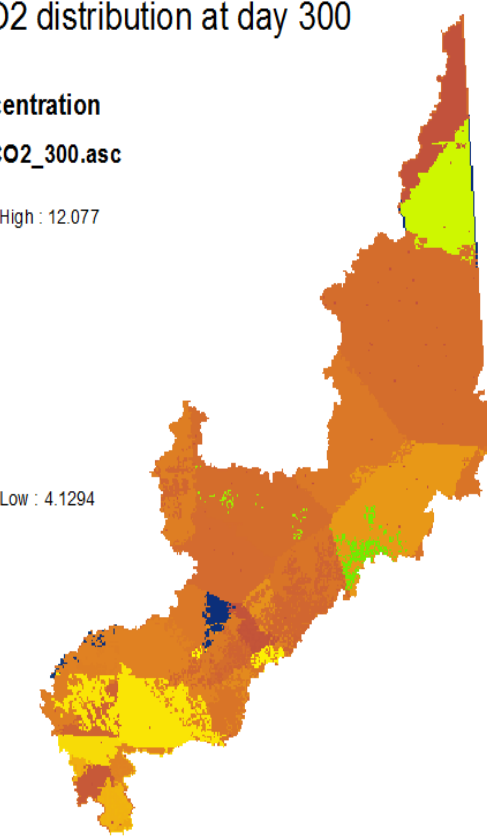

CO2 distribution at day 200

Concentration  
gis\_CO2\_200.asc  
Value

CO2 distribution at day 300

gis\_CO2\_300.asc  
Value

# N<sub>2</sub>O distribution

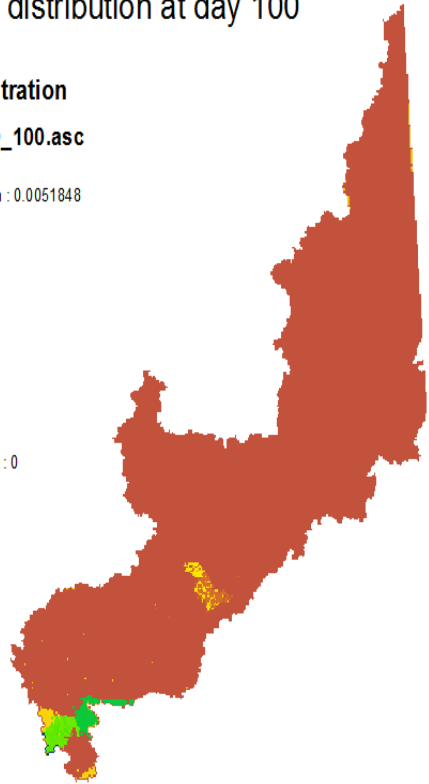

N2O distribution at day 100

Concentration

gis\_n2O\_100.asc

Value

High : 0.0051848

N2O distribution at day 200

Concentration

gis\_n2O\_200.asc

Value

High : 0.035757

N2O distribution at day 300

Concentration

gis\_n2O\_300.asc

Value

High : 0.031763

# Conclusion

- A fully regional DNDC has been developed coupled with hydrologic model.
- The forest module will be combined into the modified DNDC.
- The wetland module requires to be standardized in future.
